

Ruslan Korolev

Senior Frontend Developer • ruslan.korolev29@gmail.com • Telegram: @infinitybuddha

SUMMARY

Senior Frontend Developer with 8+ years of experience building product web applications with JavaScript, TypeScript and React. I own features end to end, from shaping UX flows together with product managers and designers through to release, automated testing and ongoing support. I have worked on CRM systems, dashboards and internal tools across the security, edtech and fintech domains, including products serving tens of thousands of concurrent users. My experience covers migrating large applications to new major framework versions without regressions, cutting build times several times over, setting up end-to-end analytics and mentoring junior developers. I write structured, readable and maintainable code, and I am comfortable turning changing requirements into clear, working product solutions.

TECH STACK

Core: React, TypeScript, JavaScript (ES6+), HTML5, CSS3, SCSS, CSS Modules

State & data: Redux, RxJS, Zod, Recharts, Node.js, REST API

Build & testing: Webpack, Rsbuild, Biome, Jest, Playwright, Git

Monitoring & analytics: Sentry, Google Tag Manager, Amplitude, HubSpot

KEY STRENGTHS AND RESULTS

- Migrated a large application from React 18 to React 19 with no regressions
- Owned individual product areas end to end
- Designed complex configuration forms and data-heavy interfaces (React Hooks, Zod, Recharts)
- Improved the development process: moved the build from Webpack to Rsbuild, cutting local build time by a factor of three
- Worked on high-load products serving tens of thousands of concurrent users
- Introduced quality and observability practices: Jest/Playwright, Sentry, regular code review
- Mentored junior developers

EXPERIENCE

Wallarm (cybersecurity) | Senior Frontend Developer | July 2023 — March 2026 • Built a separate multi-page product section from scratch and was the main owner of the landing page with the sign-up form, a key acquisition channel for new users

- Initiated and led the migration from React 18 to React 19: resolved incompatibilities in UI components, forms and charts; the migration shipped to production without regressions and unblocked updates across the dependency ecosystem
- Single-handedly built and fully owned the embeddable Wallarm AASM sign-up widget as a React application, including production releases
- Set up end-to-end sign-up analytics (UTM → GTM → HubSpot → Amplitude), giving the marketing team visibility into traffic sources
- Redesigned the documentation portal, and built dashboards and data-heavy interfaces with data visualisation
- Designed complex configuration forms in React with validation and interdependent states
- Worked through user scenarios, proposed simplifications and influenced product decisions
- Wrote and maintained automated tests (Jest, Playwright) for critical user flows, reducing the number of regression bugs in releases
- Moved the project from Webpack to Rsbuild, cutting local build time from 12 to 4 seconds (3x faster)

Whisk (foodtech) | Senior Frontend Developer | May 2022 — February 2023

- Developed CRM functionality for users with React, TypeScript and RxJS, and took part in API design
- Migrated components from a legacy Angular system to React and TypeScript without pausing work on new features
- Designed and developed UX/UI flows together with the product team
- Maintained the existing codebase, took part in code review and reduced the number of production bugs
- Worked closely with backend developers and other stakeholders

Uchi.ru (edtech) | Frontend Developer | September 2019 — May 2022

- Extracted the user account area from the monolith into a standalone React application (SPA) with its own release cycle, removing the dependency on monolith releases and enabling daily releases
- Built the user account area for one of the largest edtech platforms in Russia using React, Redux and TypeScript, a product with tens of thousands of concurrent users at peak load

- Optimised frontend performance, improving load times and interface responsiveness for end users
- Built reusable UI components and developed the internal React UI library, speeding up work on new features
- Introduced Sentry error monitoring, cutting the time it took to detect frontend errors before users reported them to support
- Mentored a developer with no React experience (application architecture, code style, separation of concerns) up to the point of delivering features independently
- Took part in REST API design together with backend developers and ran regular code reviews to maintain code quality

White Sky Digital (fintech) | Frontend Developer | September 2017 — September 2019

- Built, as part of a team, a dynamic form engine in React for bank client onboarding: forms were assembled from a JSON schema supplied by the backend, depending on the client type
- Implemented a multi-step wizard with validation and autosave, moving the bank's client onboarding process online
- Built a landing page builder for the marketing team using React and Node.js (CRUD API), letting them assemble pages without involving developers and reducing the load on the development team
- Developed and documented reusable components for a shared UI library used across several products
- Set up and maintained the project build on Webpack, keeping the development process stable and predictable
- Worked through implementation details together with designers and backend developers at the design stage

Zebra Group (digital agency) | JavaScript Developer | April 2017 — September 2017

- Took part in building a website constructor for producing companies' annual financial reports
- Delivered cross-browser markup and component styling with HTML5 and CSS
- Developed graphics animation and SVG charts
- Debugged and refactored interactive JavaScript components
- Wrote documentation and tests for components, and improved interface accessibility and semantics

EDUCATION

Russian University of Transport — Higher professional education, 2015

LANGUAGES

English — B2, Upper-Intermediate • Russian — Native
